Why: security reasons

1. Third-party validation comes with a price:
 - Latency
 - License coast
 - Dependency
2. Ambiguous VT results interpretation
3. Malware targeting Chinese customers is underreported to VT
4. Cloud-specific threats – is it malware or customer's binary?

A Tale of Two Cities

VirusTotal and other TI vendors

The cloud

Fuzzy hash: ssdeep

Distance(ssdeep1, ssdeep2) ~ portion of shared code

Block size

Hash1

Hash2

ssdeep fuzzy hash for Phoenix Miner family

Ref <https://www.virustotal.com/gui/file/599393e258d8ba7b8f8633e20c651868258827d3a43a4d0712125bc487eabf92>

Why no one has scaled it up?

Enough samples?

Algorithm and
computing power?

Use cases?

Great team?

**We are a cloud provider and
we have all four, so, why not?**

Sample collection

- From our cloud security product, we collect binary file hashes: MD5, SHA256 and ssdeep
- Ssdeep library size on our cloud is 100 million and counting

MD5:a4ae6d3308ba52770bf6f8aa429e2a6c

SHA256:e852258786ef31204997cd8f1b7392d2be615b7effe0a8819065cb2c8e65218a

SSDEEP:196608:0lUsEAfUY7F0e6KtTrYP7GILBqMFE2844DYIv8ZFbImQpRTUsli0w8:Js
FUYJUKtTrYSILBqMFE2844DYIv8ZF9

Engineering optimization

- Pairwise ssdeep comparison as Levenshtein edit distance
 - $O(n*n)$ or $O(m*n)$ if using dynamic programming
 - When it comes to 100M samples and their pairs, challenges appear

Without any loss of generality, here is how we did it

Pre-filtering: ssdeep normalization

Redundancy cleanup

Pre-filtering: space reduction

Block size ratio filter

7-gram block filter

7-gram heap construction

Optimized edit distance

Modified bitap with Wu, Manber* for Levenshtein

Fast clustering

Parallel ssdeep clustering

Distributed label propagation

A large graph of known ssdeep

Ssdeep lib and similarity graph of 100 millions and growing

How to keep growing? Anomaly detection!

- 100 million vs 100 million pairwise approach would not work for near real time
- General anomaly detection
 - Find the emerging samples and compare with all known ones
 - Propagate and update the ssdeep library and similarity graph

Ssdeep lib and graph (100 millions)

**Emerging samples
(millions per day)**

So we scaled it up in a graph

Zoom-in Sub graph pattern in similarity graph of labeled xorddos nodes with unknown nodes

The bird view of the xorddos similarity graph

When scaling up, it starts to rock

Knowing any **seeds**?

Look for sub-graphs

Don't have **seed**?

Look for clusters

Polymorphic and code reuse can be detected automatically at scale

XorDDoS as polymorphic malware

- XorDDoS “randmd5()” * as a simple polymorphic function to change its file hash like MD5
 - Along with randomized file names like “/usr/bin/ogjaymscci”
- A different file hash can effective bypass threat intelligence libs like VirusTotal
 - And xorddos does it much!
- Alibaba cloud has collected xorddos detection rules for years to provide enough seeds in graph

MD5:aa25ac36e2398b115dd0f12c0c8d91e0

randmd5()

MD5:59c4ec3116920bf0745ba15319971f87

* For more about Polymorphic XorDDoS, please go to
<https://blog.malwaremustdie.org/2015/09/mmd-0042-2015-polymorphic-in-elf.html>

Polymorphic means high fuzzy hash similarity

Xorddos variant #1

1536:FB0g2KIWBBnMhb1n0FlqkfJStneKjx46x0UJUHw2sPX1LGQx:FBttjv8F0FlqPe0zJUQ2s/N

↓ randmd5()

Xorddos variant #2

1536:FB0g2KIWBBnMhb1n0FlqkfJStneKjx46x0UJUHw2sPX1Le:FBttjv8F0FlqPe0zJUQ2s/4

Ssdeep similarity (variant #1, variant #2) = 0.97

A sub-graph of XorDDoS

- Unknown
- Malicious

XorDDoS on VirusTotal

SHA256:c7b9c2d1c89732219cb3fbc40f75675e19206aa13959c1a8046d58ec26a09477
<https://www.virustotal.com/gui/file/c7b9c2d1c89732219cb3fbc40f75675e19206aa13959c1a8046d58ec26a09477/community>

- Out of 211k XorDDoS samples
 - Avira: 153k detected (73%)
 - VirusTotal: 2.5k listed w/ one or more engines (1.2%)
- Yes, the polymorphic technique can bypassing VirusTotal!

Ssdeep similarity (miner #1, miner #2) = **0.82**

Ransomware and miners

When code reuse becomes a fashion

102

Mirai, Agent Tesla, and so on

Mirai and its siblings

Agent Tesla families (sparse clusters)

Recap the workflow

- Searching the graph for a new binary hash is faster and have better coverage than any third-party validation
- In-home validation approach remove uncertainty of VT result interpretation
- Presented workflow implemented in production and fed to Alibaba Cloud Security products

One question: is ssdeep essential?

- A short answer: no, any fuzzy hash can work with this approach
- A longer answer:
 - Fuzzy hash and its corresponding similarity function like LZJD can replace ssdeep
 - Machine learning models like learn-to-hash for fuzzy hash would work
 - Non-fuzzy hash but component analysis like Intezer's Genetic Software Mapping* can probably work too
 - Engineering optimization for the hash and similarity at scale is critical

Key takeaways

- Successful malware evolves and comes back again and again as seen today
- Big companies face specific malware threats and have unique security needs. It's easy to outgrow even best third-party validation
- **Label propagation** and **clustering** are the two major techniques in the **ssdeep graph framework** at massive scale used to amplify discovery with fuzzy hash
 - Ssdeep similarity is only one of many fuzzy hash similarity functions that can be used. Please feel free to replace it with your favorite one, like LZJD
- Beside **polymorphic malware**, **code reuse** in malware, fuzzy hash similarity graph can be used to detect **supply chain pollution and beyond**
